# XINJE

## S-BOX-HT
### Wireless transparent transmission module

User manual

# Basic description

- Thank you for purchasing Xinje S-BOX-HT 433M wireless transparent module.
- This manual mainly introduces the product information of S-BOX-HT module.
- Before using the product, please read this manual carefully and conduct wiring on the premise of fully understanding the contents of the manual.
- Please deliver this manual to the end user.

# This manual is suitable for the following users

- System designer
- Installation and wiring workers
- Commissioning and servo debugging workers
- Maintenance and inspection workers

# Declaration of responsibility

- Although the contents in the manual have been carefully checked, errors are inevitable, and we cannot guarantee that they are completely consistent.
- We will often check the contents of the manual and make corrections in the subsequent versions. We welcome your valuable suggestions.
- If there is any change in the contents introduced in the manual, please understand without further notice.

# Contact us

If you have any questions about the use of this product, please contact the agent and office that purchased the product, or directly contact Xinje Company.

- Tel: 400-885-0136
- Fax: 0510-85111290
- Address: No.816, Jianzhu West Road, Binhu District, Wuxi City, Jiangsu Province, China
- Post code: 214072

# Catalog

# 1. Module introduction

S-BOX-HT is independently developed based on the American Semtech LoRa$^{TM}$ radio frequency chip SX1268, with a maximum power of 1W. It is suitable for 433MHz chip LoRa$^{TM}$ wireless module, and uses industrial high-precision 32MHz crystal oscillator.

S-BOX-HT supports multiple physical interfaces: RS232/RS485/RS422. Support adjustable serial port parameters. Support 84 channels for selection. The air rate provides 9600~38400bps transmission rate. Users can adjust according to the actual situation on site.

**Note:**

(1) S-BOX-T/XD-SBOXT-ED is incompatible with S-BOX-HT

(2) S-BOX-T/XD-SBOXT-ED can only communicate with MTG765-UT

(3) S-BOX-HT can only communicate with MTG765-HT.

## 1-1. Compatibility

◆ Support RS232/RS485/RS422 serial port
◆ Support 84 channels for selection
◆ Support adjustable serial port parameters
◆ Support the adjustable air baud rate
◆ Compatible with various mainstream controllers (serial port) in the market

## 1-2. Application scenario

◆ Wireless communication between PLC and PLC, supports one master and multiple slaves (more than 4 slaves are not recommended)
◆ Wireless communication between PLC and wireless touch screen MTG765-HT

## 1-3. Version explanation

| Hardware | Firmware | Config tool | Explanation |
|----------|----------|-------------|-------------|
| H1 | V1.1.1 | V1.1.0 | This version only supports transparent transmission mode, not I/O mode |

# 2. Performance and parameters

## 2-1. Structure

■ S-BOX-HT

**Note: V1.1.1 cannot support I/O terminal temporarily**

## 2-2. Dimension

Overall dimension of S-BOX-HT is 43.0mm × 110.0mm × 75.0mm (width × height × Depth). It can be directly installed on DIN46277 (width 35mm) guide rail.

**Note:**

(1) When processing screw holes and wiring during installation, do not let chips and wire chips fall into the module.

(2) Before connecting, please confirm the specifications of the module and the connecting device again to ensure that there are no errors.

(3) When connecting, please pay attention to whether the connection is firm. If the connection falls off, it will cause incorrect data, short circuit and other faults. Installation and wiring operations must be carried out after all power supplies are cut off.

## 2-3. LED light

```
[ ] PWR                    [ ]
[ ] TXD              [ ]   [ ]
                433
[ ] RXD        [ ]   [ ]   [ ]

   [ ] [ ] [ ]   [ ]   [ ]   [ ]
   X0  X1  X2    Y0    Y1    Y2
```
The LED light functions of S-BOX-HT are shown in the following table:

| LED light | Explanation |
|---|---|
| PWR | Power supply, always on after power on |
| TXD | Flash once for each packet of data sent by the serial port, and flash in the configuration mode |
| RXD | Flash once for each packet received by wireless, and flash in configuration mode |
| signal intensity | 433MHz signal strength indicator |
| X0-X2 | Input signal (V1.1.1 cannot support) |
| Y0-Y2 | Output signal (V1.1.1 cannot support) |

**Note:** Signal strength indicates the signal strength when the last packet of data is received wirelessly

## 2-4. Dial switch

■ S-BOX-HT

```
        ON
1 [    ]
2 [    ]
3 [    ]
4 [    ]
```
DIP1: switch between operating mode and configuration mode. When ON, it is the configuration mode. TXD and RXD flash together in configuration mode.

DIP2: switch between transparent transmission mode and I/O mode. I/O mode when ON. (V1.1.1 does not support I/O mode temporarily).

DIP3, 4: wireless transmission rate. The higher the wireless baud rate, the lower the communication delay, and the shorter the transmission distance.

Wireless communication distance corresponding to different baud rates:

| DIP3 | DIP4 | Air transmission rate | Open transmission distance between modules (for reference) | Open transmission distance between module and PLC (for reference) |
|---|---|---|---|---|
| OFF | OFF | 4800bps | 350m | 150m |
| OFF | ON | 9600pbs | 300m | 130m |
| ON | OFF | 19200bps | 250m | 100m |
| ON | ON | 38400bps | 200m | 80m |

**Note:**

(1) To ensure the stable transmission and connection of the equipment signal, be sure to use the standard signal antenna!

(2) DIP3 and DIP4 are used to set the air transmission baud rate. The dial switches between the two S-BOX-HTs or between the S-BOX-HT and the MTG765-HT must be set consistently.
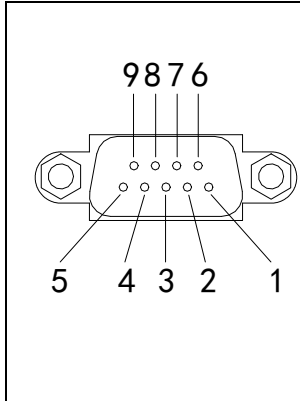

## 2-5. Communication port

S-BOX-HT has a full function serial port, supports RS232/RS485/RS422, and has an external RS485 terminal.

RS485 and RS232/RS422 are from the same serial port, cannot be used at the same time.

DB9 terminal pins are defined as follows:

| Pin | Definition | Explanation |
|---|---|---|
| 1 | TD+ | RS422 send + |
| 2 | RXD | RS232 receive data |
| 3 | TXD | RS232 send data |
| 4 | A | RS485 + |
| 5 | GND | Signal ground |
| 6 | TD- | RS422 send - |
| 7 | B | RS485 - |
| 8 | RDD- | RS422 receive - |
| 9 | RDD+ | RS422 receive + |

## 2-6. General specification

| Item | Specification |
|---|---|
| Using environment | No corrosive gas |
| Ambient temperature | 0℃~60℃ |
| Storage temperature | -20~70℃ |
| Ambient humidity | 5~95%RH |
| Storage humidity | 5~95%RH |
| Installation | Directly installed on DIN46277 (35mm wide) guide rail |
| S-BOX-HT power supply | The power supply voltage of the module is 24V DC, and the allowable range is DC 21.6V~26.4V |
| MTG765-HT endurance | 7-8 hours of full charge |

# 3. S-BOX-HT parameter configuration

When S-BOX-HT is used, serial port communication parameters and RF parameters need to be set.

## 3-1. Preparation

1. S-BOX-HT config tool SBoxTool.exe.

2. OP cable

Prepare an OP cable for connecting the DB9 pin serial port of the computer. If there is no OP cable, the cable can be self-made as shown in the figure below. If the computer does not have a DB9 pin serial port, a USB to serial port convertor is also required.

## 3-2. S-BOX-HT configuration

1. Turn dial switch DIP 1 to ON, and TXD and RXD of the module flash at the same time, indicating that the module is in configuration mode.

2. Connect the computer and S-BOX-HT through the programming cable

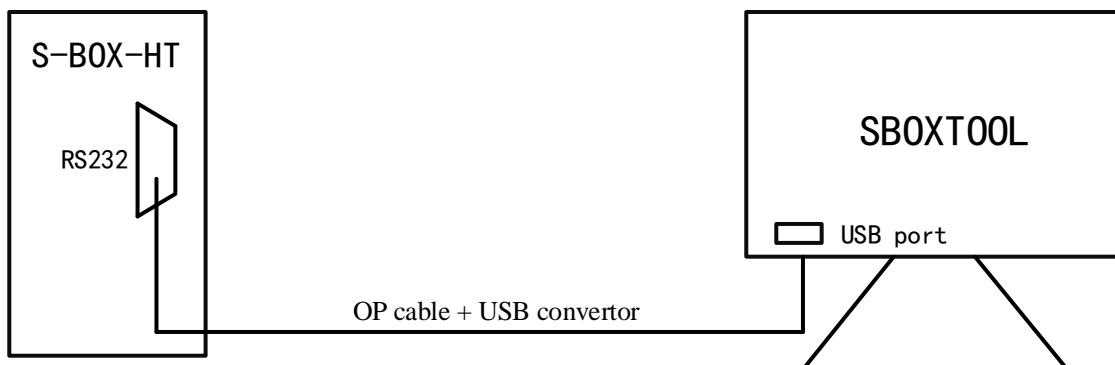

3. After the module is successfully connected to the computer, open SBoxTool.exe, select the COM port corresponding to the computer, click Open Serial Port, and you can directly read the information of the module.

4. Set the serial port parameters of the module, which should be consistent with the connected PLC serial port parameters. The default factory serial port parameters are 19200, 8, 1, E. Click Write after setting.

5. RF parameters: set the channel of the module, and only devices with the same channel can communicate. The timeout is the allowable timeout on the wireless side, which is generally set to 500ms. Click Write after configuration.

6. After the module configuration is completed, turn the dial switch 1 to OFF, and the module is set to the operation mode.

# 4. Communication between MTG765-HT and PLC through S-BOX-HT

The wireless communication between the HMI MTG765-HT and PLC can be realized through S-BOX-HT. The network connection diagram is as follows:

PLC communicates with S-BOX-HT through serial port, and S-BOX-HT communicates with MTG765-HT through wireless network. The following conditions must be met for successful communication:

(1) The channel and air baud rate of S-BOX-HT and MTG765-HT must be set consistent

(2) The serial port of S-BOX-HT, PLC port of HMI and serial port parameters of PLC must be consistent

(3) RS232/RS485/RS422 wiring of physical layer shall meet the specification.

As a transparent transmission module, S-BOX-HT theoretically supports communication with all serial port devices. The following will illustrate the specific operation steps with Xinje XD series PLC as an example.

## 4-1. Operation steps

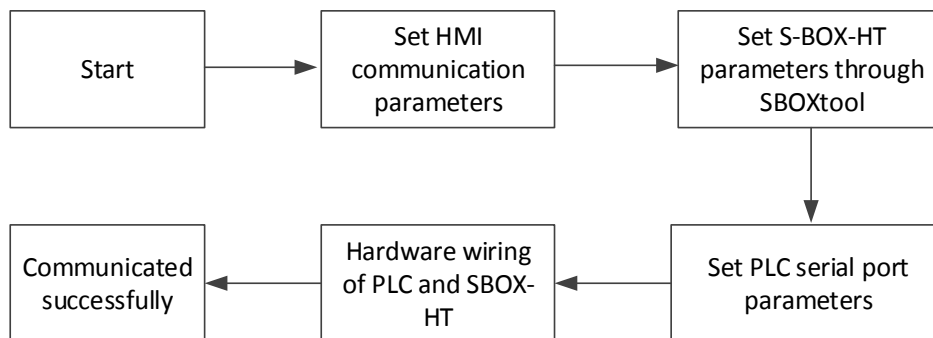

## 4-2. MTG765-HT communication parameters

1. Set the air baud rate of the HMI through the dial switch. The dial switch of the MTG765-HT is black and its position is as follows:
The MTG765-HT dialing function is defined as follows:

| Dial switch | Definition |
|---|---|
| DIP 1 | Always OFF |
| DIP 2 | Always OFF |
| DIP 3 | Adjust the air transmission rate |
| DIP 4 | Adjust the air transmission rate |

The specific transmission rate is shown in the following table:

| DIP3 | DIP4 | Air transmission rate | Air transmission distance (for reference) |
|---|---|---|---|
| OFF | OFF | 4800bps | 150m |
| OFF | ON | 9600pbs | 130m |
| ON | OFF | 19200bps | 100m |
| ON | ON | 38400bps | 80m |

2. Connect the computer to MTG765-HT through the programming cable:

3. The version of HMI programming software shall be V2.E.6 or above.

4. Create a new project, select MTG765-HT (N) and click next.

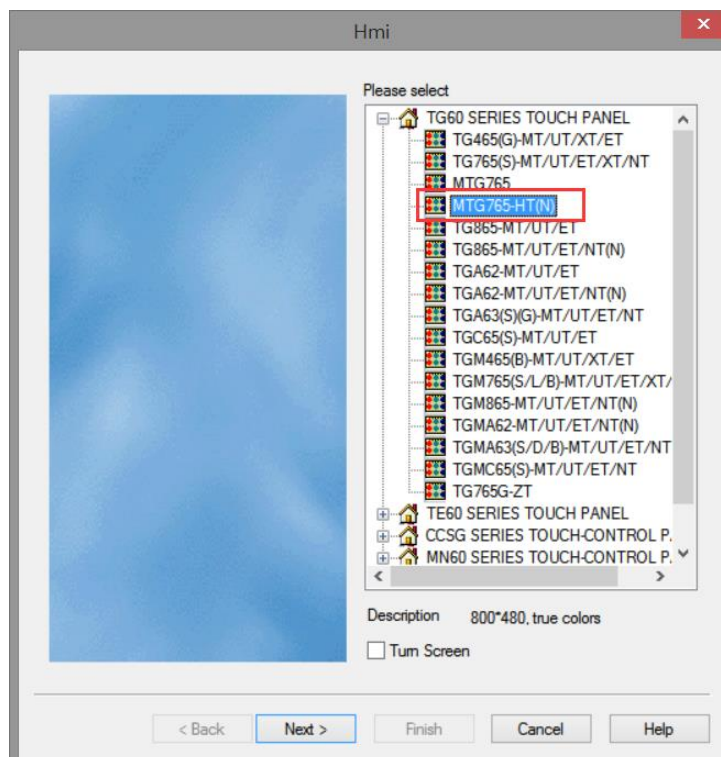

5. Set PLC port device and communication parameters.

The PLC connected with S-BOX-HT shall be set here, and the communication parameters shall be consistent with the PLC serial port parameters. The download port remains default and cannot be modified.

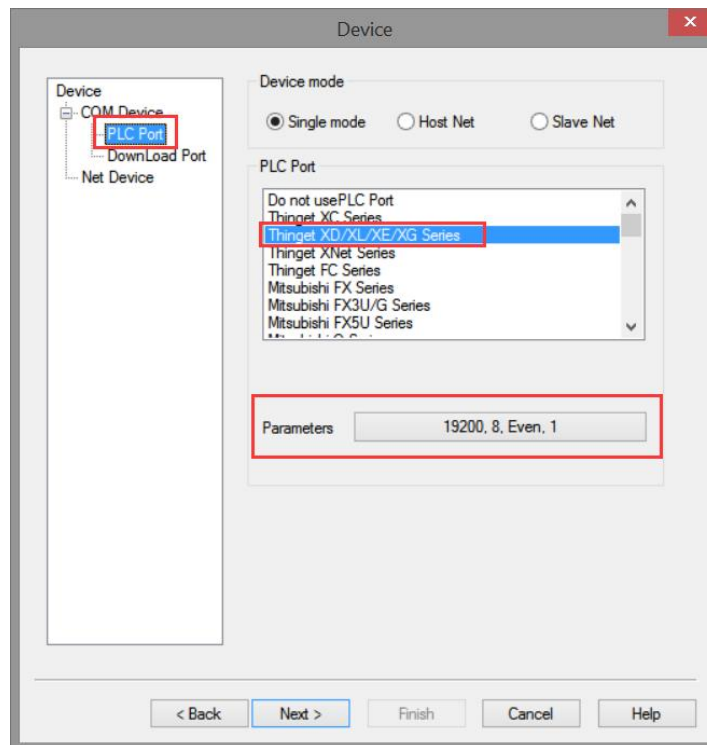

6. Open the wireless communication configuration interface in the following three ways:

Method 1: The system screen ID 60012 is the wireless screen setting interface. In the user interface, you can add "Screen Jump" button to specify the jump screen ID as "60012", and enter the configuration interface.

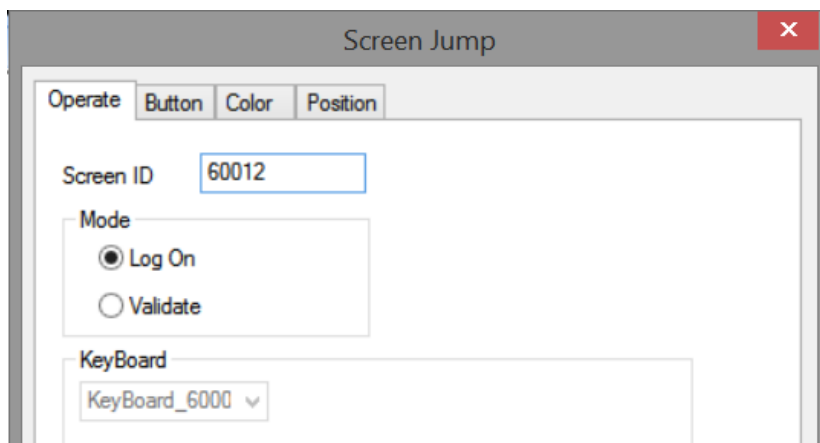

Method 2: Turn ON the DIP 3 of the HMI, and enter the system interface after power on again.

Method 3: When starting up, long pressing the touch screen interface will automatically jump to the setting interface.

7. Set the channel on the configuration interface, which is consistent with the channel of S-BOX-HT on the PLC side. It is recommended to set the timeout as 500ms.

The communication serial port information in the figure above is the parameter set when selecting the equipment protocol connected to the PLC port in step 4 above. SBOX serial port information is the serial port parameter of SBOX built in the touch screen. By default, it will be consistent with the PLC port parameter of the HMI, and they cannot be modified after downloading the HMI program.

## 4-3. S-BOX-HT communication parameters

### 4-3-1. Preparation

1. S-BOX-HT config tool SBoxTool.exe.

2. OP cable

Prepare an OP cable for connecting the DB9 pin serial port of the computer. If there is no OP cable, the cable can be self-made as shown in the figure below. If the computer does not have a DB9 pin serial port, a USB to serial port convertor is also required.

### 4-3-2. S-BOX-HT configuration

1. Turn DIP 1 to ON, TXD and RXD of the module flash at the same time, indicating that the module is in configuration mode.

2. Connect the computer and S-BOX-HT through the programming cable

3. After the connection is successful, open SBoxTool.exe, select the corresponding COM port, and click Open Serial Port. The information of the module can be read directly.

4. Set the serial port parameters of the module, which should be consistent with the connected PLC serial port parameters, so that the module can communicate with PLC. The default serial port parameters are 19200, 8, 1, E. Click Write after setting.

5. RF parameters: Set the channel of the module for wireless communication, which must be consistent with the MTG765-HT channel settings. The timeout is the allowable timeout on the wireless side, which is generally set to 500ms. Click Write after configuration.

6. After the module configuration is completed, turn DIP 1 to OFF and set the module to the operation mode.

7. Set the DIP3 and DIP4 switch of S-BOX-HT according to the requirements of the chapter 2-4 Dial Switch. The switch settings must be consistent with the air baud rate setting of the HMI, otherwise communication will not be possible.

## 4-4. Set PLC serial port parameters

1. Connect the computer and PLC through the programming cable

2. Set the PLC serial port parameters

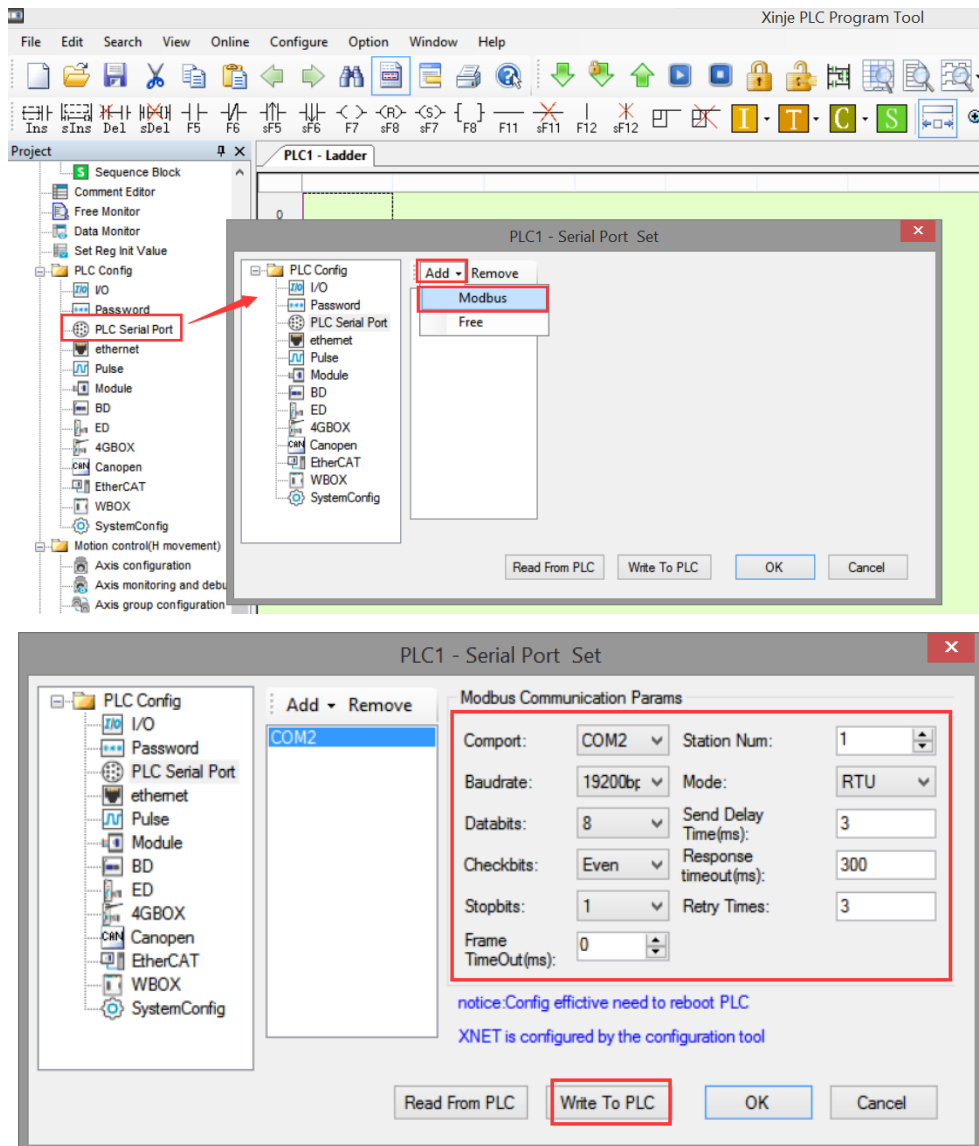

The default communication parameters of Xinje XD/XE series protocols are: 19200bps baud rate, 8 data bits, 1 stop bit, and even parity.

After the parameters are modified, power on again, and the parameters take effect. After the parameters of PLC and S-BOX-HT serial ports are consistent, they can communicate normally. As the default parameters of Xinje XD series COM2 port are the same as those of S-BOX-HT, no special setting is required. If other brands of PLC

are used, the serial port parameters of S-BOX-HT and PLC must be consistent. For other brands of PLC, refer to the section "4-6. Communication settings and connections of common PLC".

## 4-5. Connection between PLC and S-BOX-HT

After completing the parameter settings in the first three sections, as long as the connection between PLC and S-BOX-HT is successfully established, the remote communication between MTG765-HT and PLC can be realized. XD series PLC can be connected with S-BOX-HT through RS232 or RS485 port. You can make cable by yourself as the following diagram.

1. XD/XL/XG series PLC CPU unit (RS232 port)

SBOX-HT port                                    Xinje XD/XE series PLC unit RS232 port

Diagram 1

2. XD/XL/XG series PLC CPU unit (RS485 port)

SBOX-HT port                                    Xinje XD/XE series PLC unit RS485 port

Diagram 2

After successful connection, MTG765-HT remote control PLC can be realized.

# 4-6. Communication setting and connection of common PLC

## 4-6-1. Communication with Xinje XC series

1. Device type

| Series | CPU | Connection module | Com port | Cable | PLC model selection in Touchwin software |
|--------|-----|-------------------|----------|-------|-------------------------------------------|
| XC | XC1 XC2 XC3 XC5 XCC XCM | PLC serial port | RS232 | Diagram 1 | Xinje XC series |
| | | | RS485 | Diagram 2 | |
| | | XC-COM-BD expansion board | RS232 | Diagram 3 | |
| | | | RS485 | Diagram 4 | |

2. Parameter setting

(1) HMI setting

| Parameter | Recommended setting | Optional setting |
|-----------|---------------------|------------------|
| PLC type | Xinje XC series | XC series/Modbus RTU (panel is Master) |
| Com port | RS232 | RS232/RS485 |
| Data bit | 8 | |
| Stop bit | 1 | |
| Parity | Even | |
| Baud rate | 19200 | 4800/9600/19200/38400/57600/115200 |
| Station no. | 1 | 0~255 |

Default communication parameters of Xinje XC series protocols:

(2) PLC setting

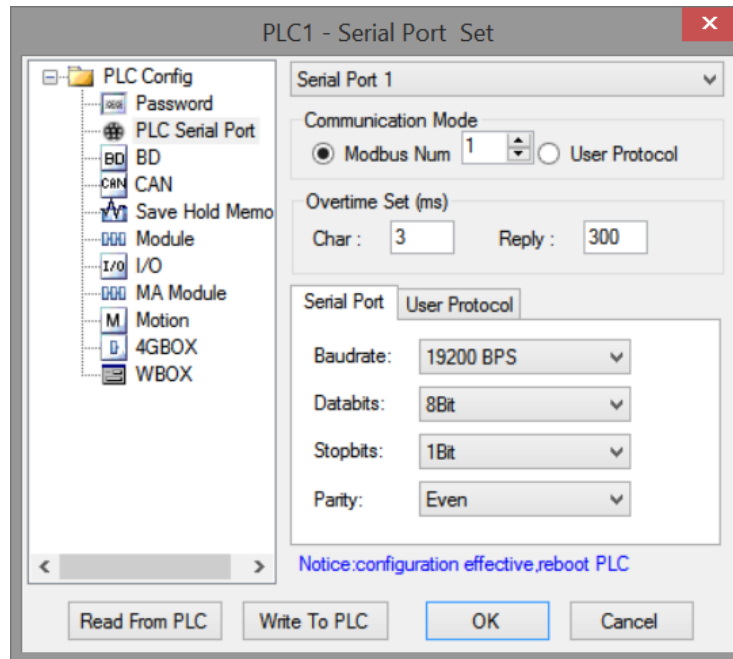

3. Cable making

① XC series PLC CPU unit (RS232 port)

    S-BOX-HT DB9 port                             Xinje XC series PLC unit RS232 port

| 2 | RXD | — | 5 | TXD |
| 3 | TXD | — | 4 | RXD |

## 4-6-2. Communicate with ABB PLC

1. Device type

ABB can communicate with Xinje HMI through Modbus protocol.

| Series | Communication type | Cable | PLC model selection in Touchwin software |
|--------|--------------------|-------|------------------------------------------|
| AC500 | PM564-T-ETH | Diagram 1 | ABBAC500 series |

2. Parameter setting

(1) HMI setting

| Parameter | Recommended setting | Optional setting |
|-----------|---------------------|------------------|
| PLC type | ABB AC500 series | ABB AC500 series<br>Modbus RTU (panel is Master) |
| Port | RS485 | |
| Data bit | 8 | |
| Stop bit | 1 | |
| Parity | No parity | |
| Baud rate | 19200 | 9600/19200 |
| Station no. | 1 | 0~255 |

ABB AC500 default communication parameters:
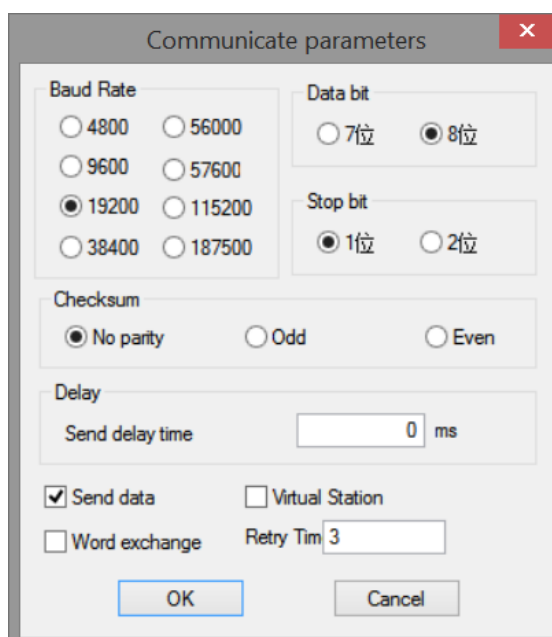

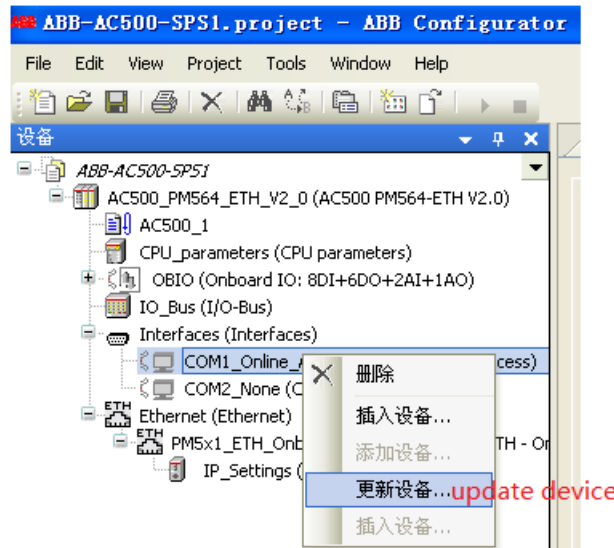

(2) PLC setting

① In the ABB AC500 PLC software serial port setting, you need to select the Modbus protocol

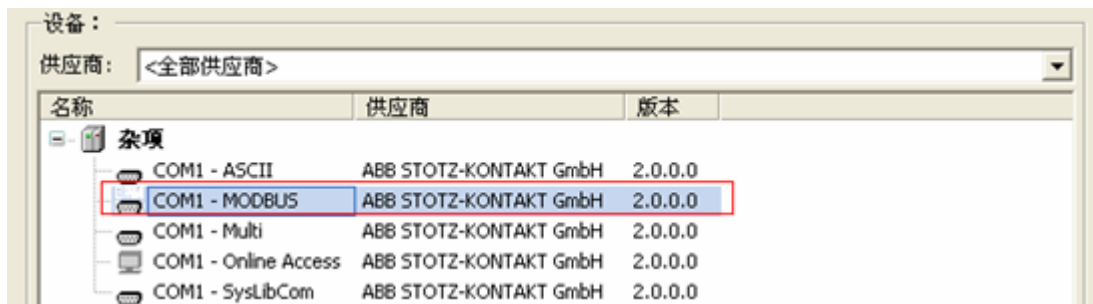

② After selecting COM1 MODBUS, the serial communication setting needs to set "Operation mode" to "Slave", and other parameter settings should be consistent with the HMI.

2. Cable making

Communication cable with ABB COM1 (RS485)

SBOX-HT port                                    ABB AC500 series PLC COM1 (RS485) port

## 4-6-3. Communicate with DELTA DVP series PLC

1.  Device type

| Series | Connection module | Port | Cable | PLC selection in Touchwin software |
|---|---|---|---|---|
| DVP-EH DVP-ES DVP-EX | CPU directly connection | RS232 | Diagram 1 | Delta (DVP) |
| | | RS485 | Diagram 2 | |
| DVP-SS DVP-SA DVP-SC DVP-SX | | RS232 | Diagram 1 | |
| | | RS485 | Diagram 2 | |

2. Parameter setting

(1) HMI setting

| Parameter | Recommended setting | Optional setting |
|---|---|---|
| PLC type | Delta (DVP) | |
| Port | RS232 | RS232/RS485 |
| Data bit | 7 | |
| Stop bit | 1 | |
| Parity | Even | |
| Baud rate | 9600 | 9600/19200 |
| Station no. | 1 | 0~255 |

Default communication parameters of Delta (DVP) protocol:
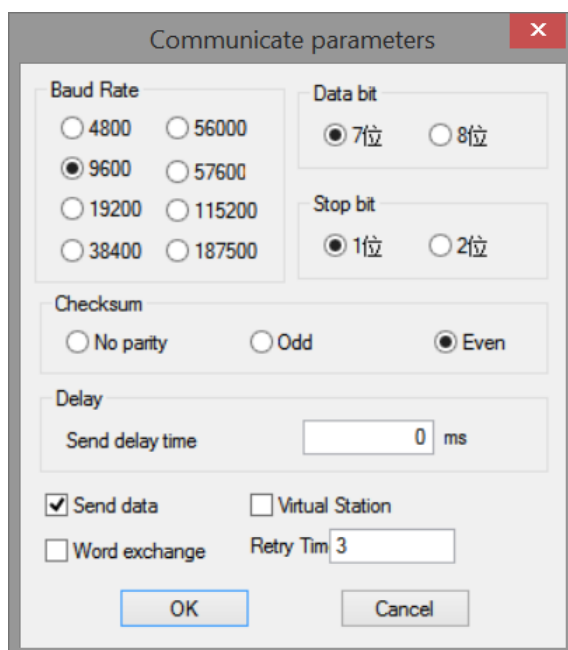

3. Cable making

① When using the RS232 communication serial port on the CPU unit, the cable diagram is as follows:

S-BOX-HT port                                    Delta DVP series RS232 port 8-pin male plug

| 2 | RXD |
| 3 | TXD |
| 5 | GND |

| 5 | TXD |
| 4 | RXD |
| 8 | GND |
Diagram 1

② When using the RS485 communication serial port on the CPU unit, the cable diagram is as follows:

S-BOX-HT port                                    Delta DVP series RS485 port

| 4 | A |

## 4-6-5. Communicate with Mitsubish FX series PLC

1.  Device type

| Series | CPU | Connection module | Port | Cable | PLC selection in Touchwin software |
|---|---|---|---|---|---|
| FX | FX0 FX1 FX1S/3S FX0N/1N/2N FX3SA-14MR-CM | CPU directly connection | RS422 | Diagram 1 | Mitsubishi FX series |
|  | FX2 | CPU directly connection | RS422 | Diagram 2 |  |

2. Parameter setting

(1) HMI setting

| Parameter | Recommended setting | Optional setting |
|---|---|---|
| PLC type | Mitsubishi FX series |  |
| Data bit | 7 |  |
| Stop bit | 1 |  |
| Parity | Even |  |
| Baud rate | 9600 | 4800/9600/19200 |
| Station no. | 0 |  |

Default communication parameters of Mitsubishi FX series protocol:

(2) PLC setting

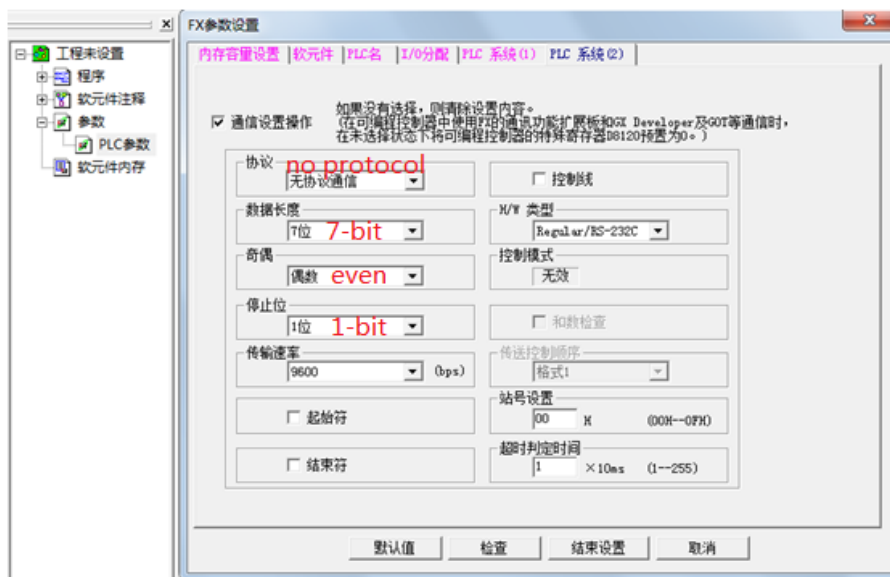

Note: The parity of Mitsubishi software is "odd" by default, but when communicating with Xinje HMI, you must change the "odd" to "even", otherwise, even if the HMI is changed to "odd" to keep consistent with Mitsubishi, the communication will not work. After the communication parameters are written into the PLC, you need to power off and then power on to take effect.

## 3. Cable making

## 4-6-6. Communicate with Mitsubish FX BD (232/485)

1. Device type

| Series | CPU | Connection module | Port | Cable | PLC selection in Touchwin software |
|--------|-----|-------------------|------|-------|-----------------------------------|
| FX | FX0N/1N/2N FX1S FX3U/3G | RS232-BD | RS232 | Diagram 1 | Mitsubishi FXBD (232/485) |
| | | RS485-BD | RS485 | Diagram 2 | |

Note: All equipment shall not be plugged or unplugged with electricity. When 485-BD is used, the protocol supports multiple station numbers.

2. Parameter setting

(1) HMI setting

| Parameter | Recommended setting | Optional setting |
|-----------|--------------------|-----------------| 
| PLC type | Mitsubishi FXB (232/485) | |
| Data bit | 7 | |
| Stop bit | 1 | |
| Parity | Even | |
| Baud rate | 9600 | 9600/19200/38400 |
| Station no. | 0 | 0~255 |

Mitsubishi FX BD (232/485) protocol default communication parameters:

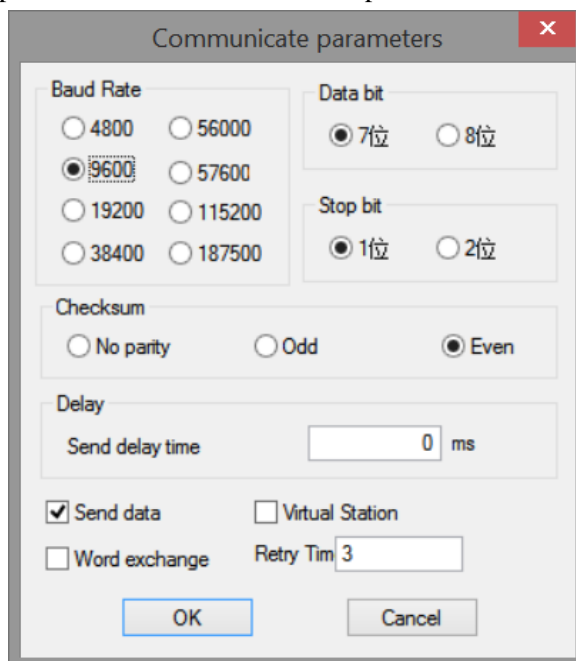

(2) PLC setting

The following figure shows the setting of RS485 BD communication parameters:

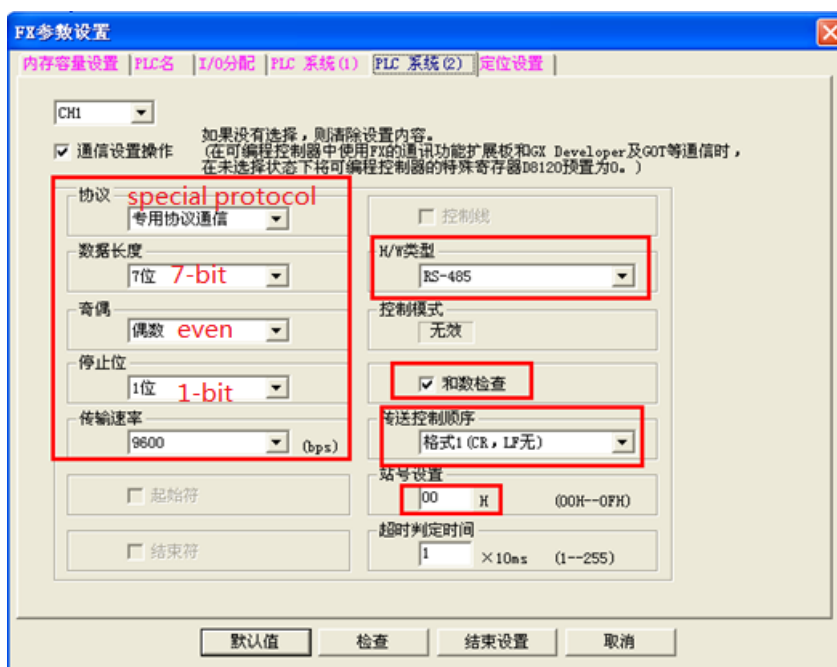

Note:

(1) When 232-BD is used, RS-232 is selected for H/W type.

(2) After the PLC parameters are modified, the parameters must be written into the PLC and then powered on again to take effect!

3. Cable making

① FX series PLC RS232-BD:

S-BOX-HT port

MITSUBISHI PLC FX series RS232-BD
9-pin D-type male plug

| 2 | RXD |
| 3 | TXD |
| 5 | GND |

| 2 | RX |
| 3 | TX |
| 5 | GND |

## 4-6-7. Communicate with Mitsubish FX3U/G/GA series PLC

1. Device type

| Series | CPU | Connection module | Port | Cable | PLC selection in Touchwin software |
|--------|-----|-------------------|------|-------|-----------------------------------|
| FX | FX3U FX3G FX3GA | CPU directly connection | RS422 | Diagram 1 | Mitsubishi FX3U/G series |

2. Parameter setting

(1) HMI setting

| Parameter | Recommended setting | Optional setting |
|-----------|--------------------|--------------------|
| PLC type | Mitsubishi FXB (232/485) | |
| Data bit | 7 | |
| Stop bit | 1 | |
| Parity | Even | |
| Baud rate | 9600 | 9600 |
| Station no. | 0 | |

Default communication parameters of Mitsubishi FX3U/G/GA protocol:

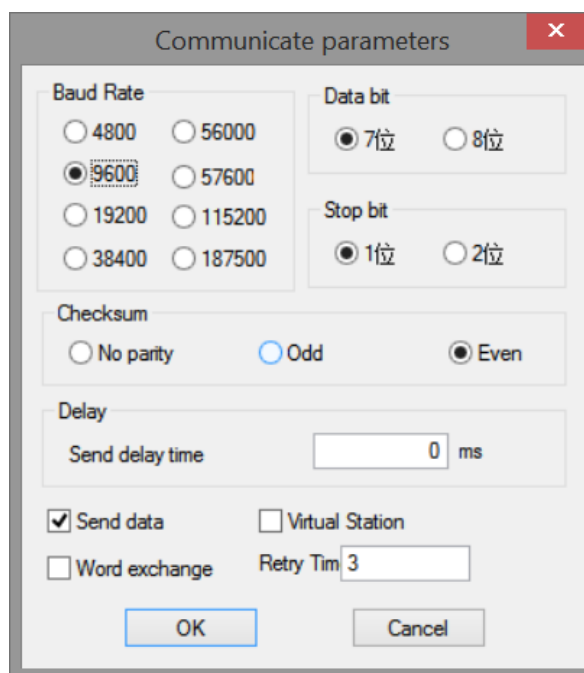

(2) PLC setting

Note: The parity of Mitsubishi software is "odd" by default, but when communicating with Xinje HMI, you must change the "odd" to "even", otherwise, even if the HMI is changed to "odd" to keep consistent with Mitsubishi, the communication will not work. After the communication parameters are written into the PLC, you need to power off and then power on to take effect. When communicating with FX3U, the baud rate can only be "9600", and other baud rates cannot communicate.

3. Cable making

FX3U/G/GA series PLC RS422:

S-BOX-HT port                           MITSUBISHI PLC FX seriesCPU RS422
                                                port 8-pin male plug

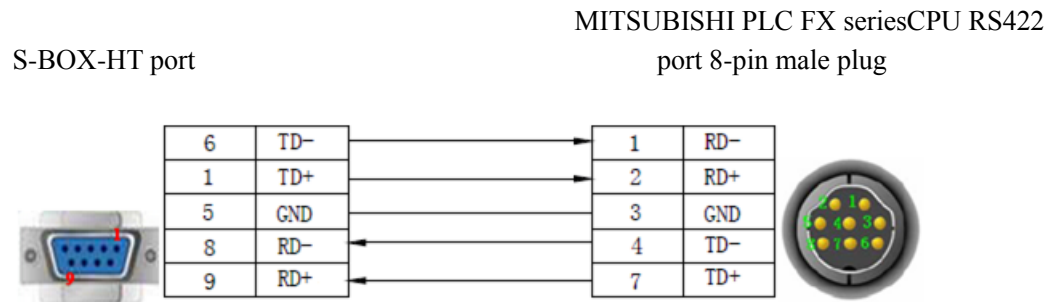

Diagram 1

## 4-6-8. Communicate with Mitsubish FX5U series PLC

1. Device type

| Series | CPU | Connection module | Port | Cable | PLC selection in Touchwin software |
|---|---|---|---|---|---|
| FX5U series | FX5U | CPU directly connection | RS485 | Diagram 1 | Mitsubishi FX5U series |

2. Parameter

(1) HMI setting

| Parameter | Recommended setting | Optional setting | Note |
|---|---|---|---|
| PLC type | Mitsubishi FX5U series | Mitsubishi FX5U series / Q series | When selecting Q series, input and output point decimal |
| Port | RS485 | | |
| Data bit | 8 | | |
| Stop bit | 1 | | |
| Parity | Odd | | |
| Baud rate | 19200 | | |
| Station no. | 0 | | Recommended settings must be used |

Mitsubishi FX5U series communication parameter settings:

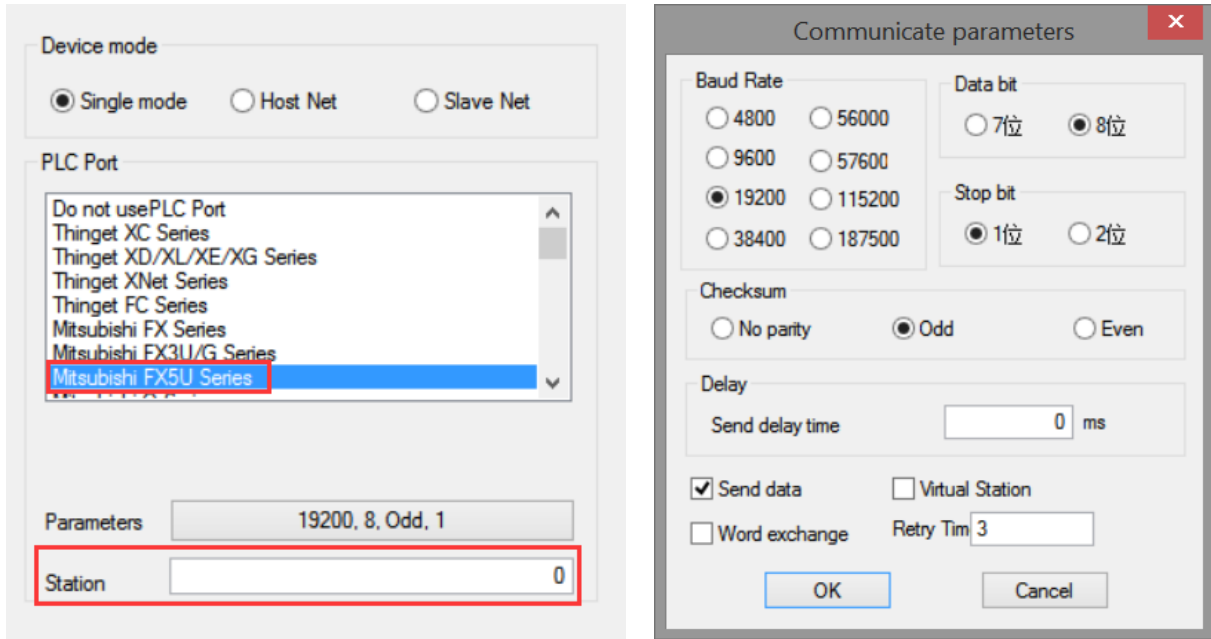

Note: The Panel station no. is 0, please don't change it.

(2) PLC setting

① MC protocol communication

Set the protocol format to "MC Protocol" and the text transmission mode to "Mode 5" in 485 serial port settings.
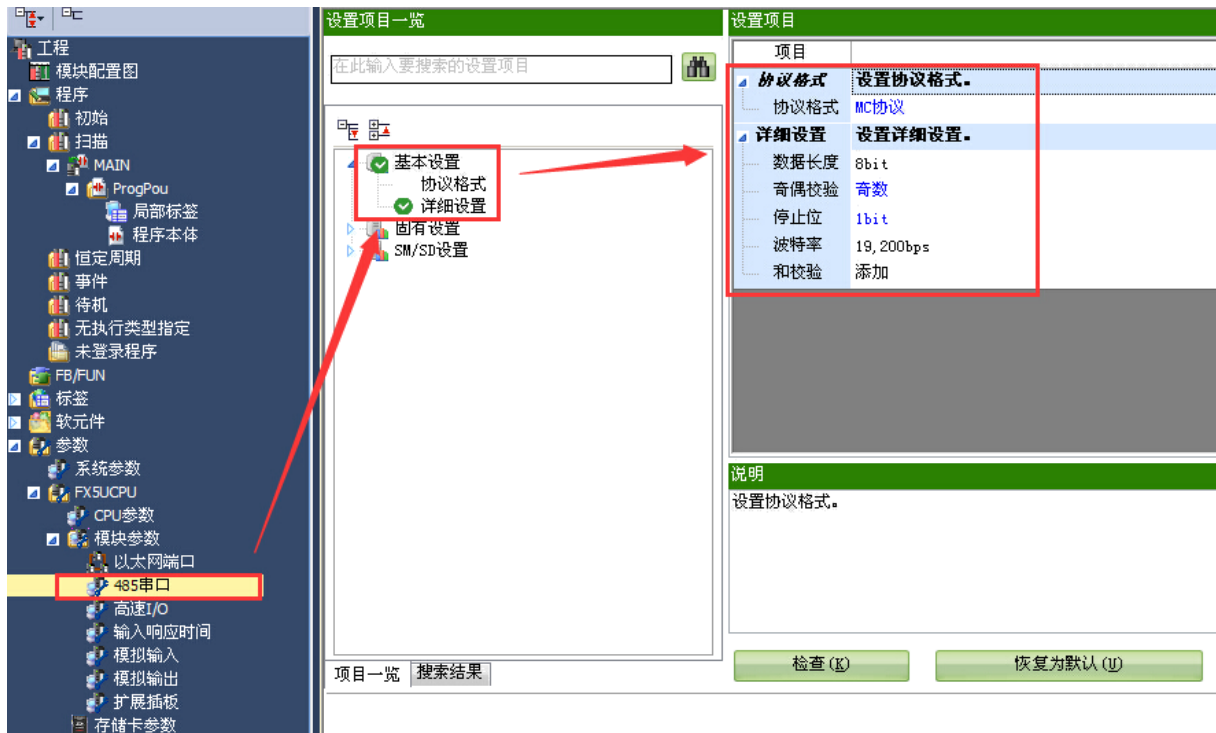

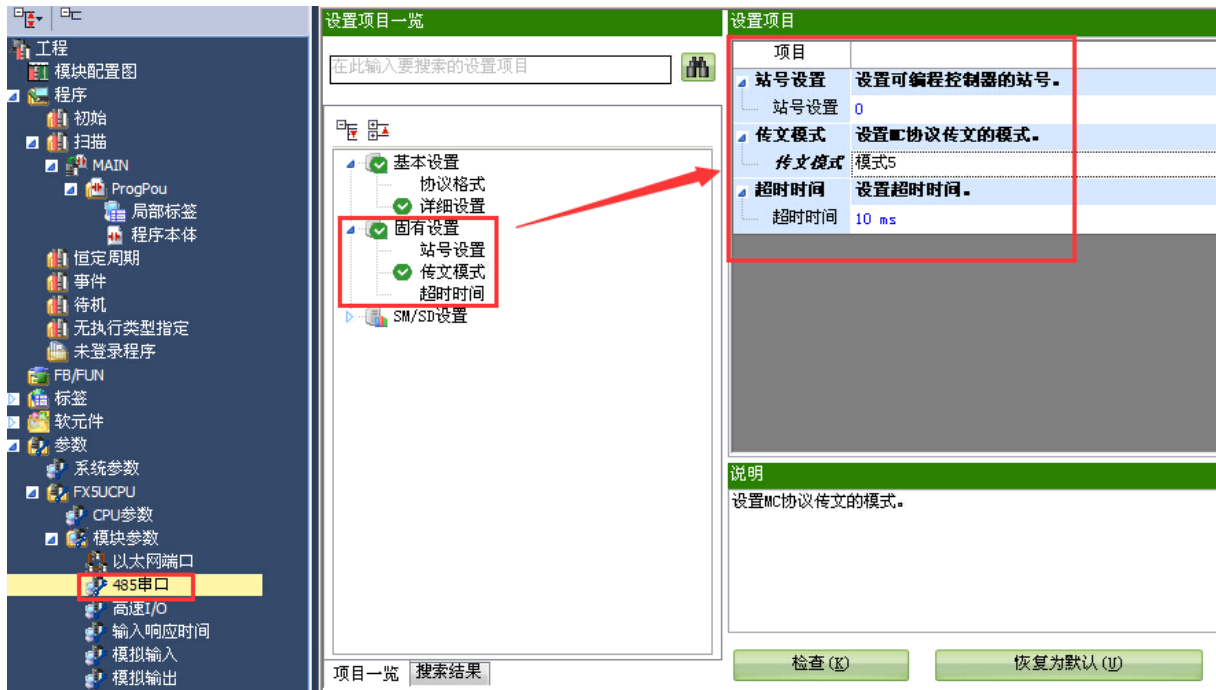

② Modbus RTU communication

When using this protocol, the HMI selects the "Modbus RTU" protocol.

Set the protocol format in 485 serial port to "Modbus RTU communication". Station 0 in Modbus communication represents broadcasting, so the station number should be set to a non-zero station number. The HMI should set the station number and communication parameters consistent with the PLC settings.
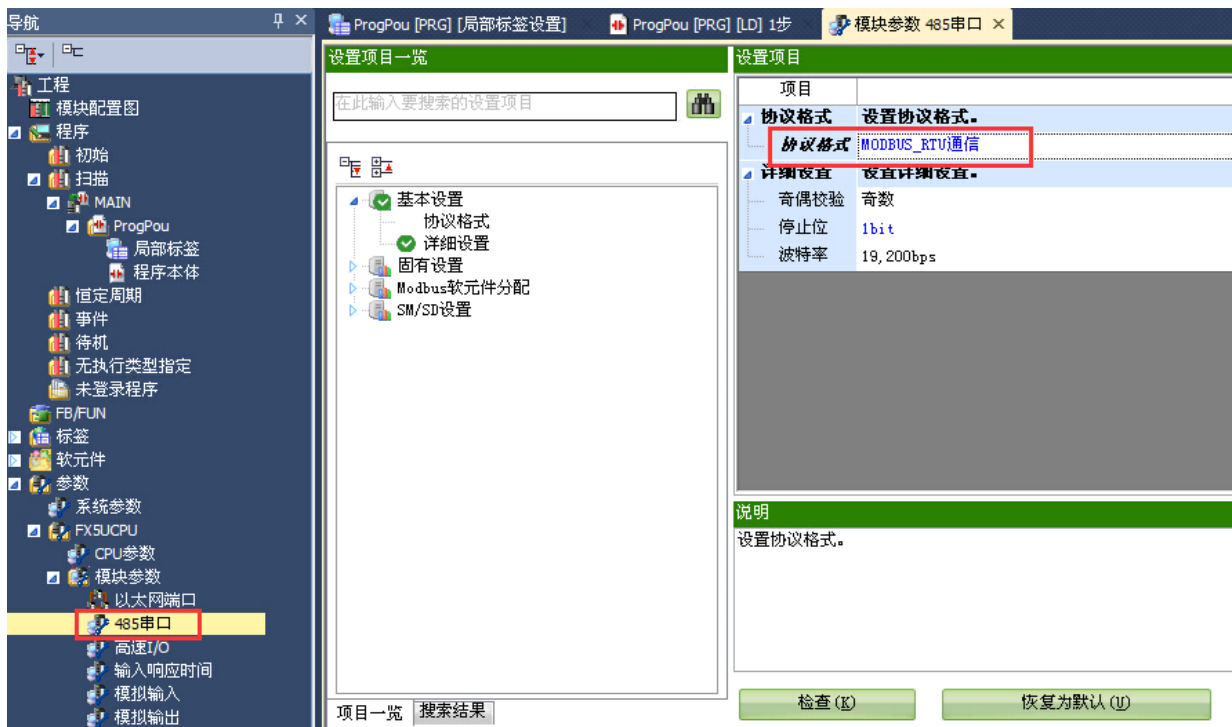

Note: When PLC is communicating with Modbus, it has a fixed Modbus address, which is described in the software. Read and write according to the Modbus address.

3. Cable making

FX5U series PLC CPU RS485 port:

S-BOX-HT port                          FX5U 4-line terminal

(2) Omron CPM/CQM series

| Series | CPU | Connection module | Port | Cable | PLC selection in Touchwin software |
|---|---|---|---|---|---|
| C series | C200HE C200HX | CPU directly connection | RS232 | Diagram 1 | Omron CPM/CQM series |
| | C1000HF | C500-LK203 | | | |

| Series | CPU | Connection module | Port | Cable | PLC selection in Touchwin software |
|--------|-----|-------------------|------|-------|-----------------------------------|
| | | module | | | |
| | C2000 | C120-LK201-V1 module | | | |
| | | C500-LK201-V1 module | | | |
| | | C500-LK203 module | | | |
| CPM series | CPM-2A CPM2AE CPM2AH-40CDR-A CPM1H | CPU directly connection | RS232 | Diagram 1 | |
| | CPM1A | OMRON CIF01 (RS232) adapter | | | |
| CQM series | CQM1H-CPU21 | CPU directly connection | | | |
| | CQM1-CPU | OMRON CIF01 (RS232) adapter | | | |

Note: Omron CPM1A and CQM1-CPU series CPU units do not support RS232 serial port communication. They can communicate by configuring CPM1-CIF01 adapter (supplied by Omron), or by using communication modules C500-LK203, C120-LK201-V1 or C500-LK201-V1.

2. Parameter setting

(1) HMI setting

| Parameter | Recommended setting | Optional setting |
|-----------|---------------------|------------------|
| PLC type | Omron CP/CJ/CS series Omron CPM/CQM series | Omron CP/CJ/CS series Omron CPM/CQM series |
| Port | RS232 | RS232/RS485 |
| Data bit | 7 | |
| Stop bit | 2 | |
| Parity | Even | |
| Baud rate | 9600 | 9600/19200/38400/57600/115200 |
| Station no. | 0 | 0~255 |

OMRON PLC CP/CJ/CS and CPM/CQM series protocol default communication parameters:
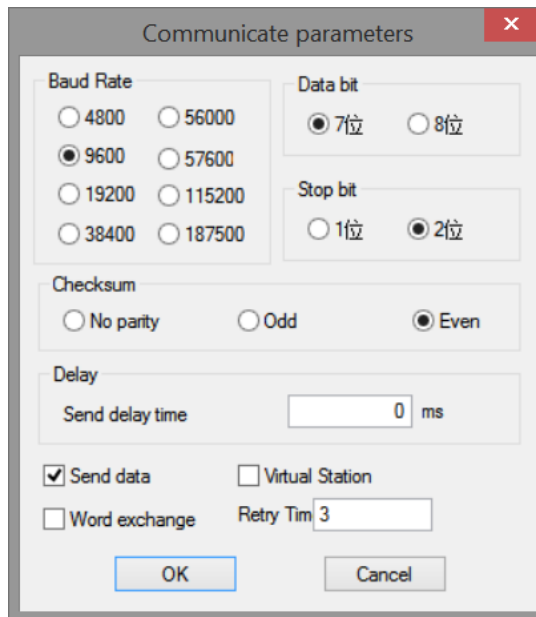

(2) PLC setting

Take Omron CP1H as an example to explain the setting of PLC communication parameters:

**Note:**

(1) In the startup item, the PLC startup mode is set to Monitor.

(2) In the setting of serial port 1, it should be set to HOST LINK. Do not power off when changing this setting

(3) Omron's default station number is 0, not 1

(4) On the PLC body, set DIP4 switch to OFF, so that serial port 1 is in SETUP status.

3. Cable making

① CPU main body RS232:

OMRON PLC
CPU/CPM1-C1F1/C500-LK203/ C120-LK201-V1
/ C500-LK203 RS232 port 9-pin male plug

S-BOX-HT port

| S-BOX-HT port | | | | OMRON PLC |
|---|---|---|---|---|
| 2 | RXD | ← | 3 | RD |
| 3 | TXD | → | 2 | SD |
| 5 | GND | | 9 | GND |
| | | | 4 | RTS |
| | | | 5 | CTS |

Diagram 1

② Communication module CP1W-CIF11 RS485:

S-BOX-HT port                    CP1W-CIF11 RS485 terminal

| S-BOX-HT port | | | CP1W-CIF11 RS485 terminal |
|---|---|---|---|
| 7 | B | | SDA- |
| | | | RDA- |
| | | | FG |
| 4 | A | | SDB+ |
| | | | RDB+ |

Diagram 2

Note:

(1) When OMRON PLC uses the communication module CPIW-CIF11 for communication, the dial switch can be set to set the communication mode:

DIP 1: selection of terminal resistance. When OFF, terminal resistance is not used, and when ON, terminal resistance is used.

DIP 2: 2-wire or 4-wire selection, OFF 4-wire (RS422), ON 2-wire (RS485), must be consistent with DIP 3 settings.

DIP 3: 2-wire or 4-wire selection, OFF 4-wire (RS422), ON 2-wire (RS485), must be consistent with DIP 2 settings.

DIP 4: Not used.

DIP 5: RS control selection for RD, OFF disables RS control, ON enables RS control.

DIP 6: RS control selection for SD, OFF disables RS control, ON enables RS control.

Please refer to OMRON PLC Hardware Manual for details.

(2) When OMRON PLC uses the communication module CPIW-CIF11 RS485 for communication, DIP 1 can be set to OFF, DIP 2/3/5/6 to ON, and DIP 4 ON or OFF.

③ Communication module CP1W-CIF11 RS422:

| SBOX-HT port | | CP1W-CIF11 RS422 terminal |
|---|---|---|
| 8 | RD- | SDA- |
| 9 | RD+ | SDB+ |
| 5 | GND | FG |
| 6 | TD- | RDA- |
| 1 | TD+ | RDB+ |

Diagram 3

Note: When OMRON PLC uses the communication module CPIW-CIF11 RS422 for communication, DIP 1/2/3/5/6 can be set to OFF and DIP 4 ON or OFF.

## 4-6-10. Communicate with Matsushita FP series PLC

1. Device type

Matsushita Mewnet FP series PLC includes FP0, FP1, FP3, FP2SF, FP10SH and other models, which can be connected to the Xinje HMI through the programming port or communication port on its CPU unit. FP0-CXXCXX models in FP0 series only support RS232 connection mode.

| Series | CPU | Connection module | Port | Cable making | PLC selection in Touchwin software |
|---|---|---|---|---|---|
| FP | FP∑ | CPU directly connection | RS232 | Diagram 1 | Matsushita (FP0/FP1) |
| | FP0 | | | | |
| | FP0R-C32CT | | | | |
| | FPG | | | | |
| | FP-X | | | | |
| | FP-M | | | | |
| | FP-E | | | | |
| | FP2 | CPU directly connection | RS232 | Diagram 1 | |
| | FP2SH | CPU RS232 port | RS232 | Diagram 2 | |
| | FP1 | CPU RS232 port | RS232 | Diagram 2 | |
| | | CPU RS422 port | RS422 | Diagram 3 | |
| | FP3 | CPU RS422 port | RS422 | Diagram 4 | |
| | FP10SH FP10S | CPU RS232 port | RS232 | Diagram 2 | |

2. Parameter setting

(1) HMI setting

| Parameter | Recommended setting | Optional setting |
|---|---|---|
| PLC type | Matsushita (FP0/FP1) | |
| Port | RS232 | RS232/RS422 |
| Data bit | 8 | |
| Stop bit | 1 | |
| Parity | Odd | |
| Baud rate | 9600 | 9600/19200/38400/57600/115200 |
| Station no. | 1 | 0~255 |

Matsushita FP0/FP1 protocol default communication parameters:

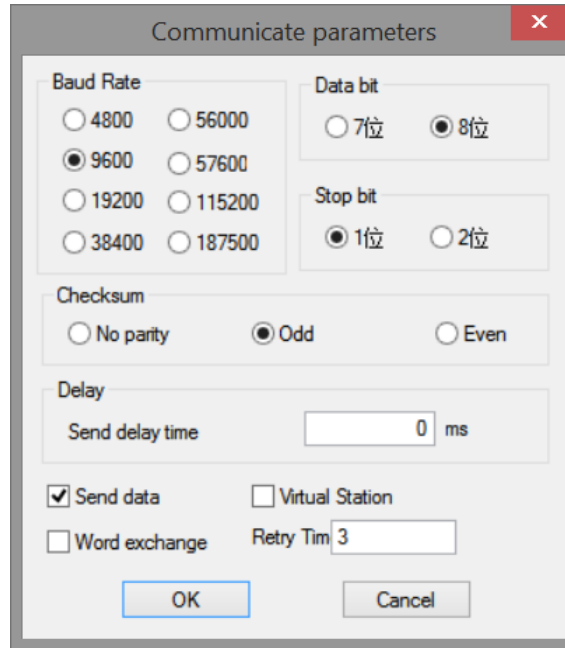

(2) PLC setting

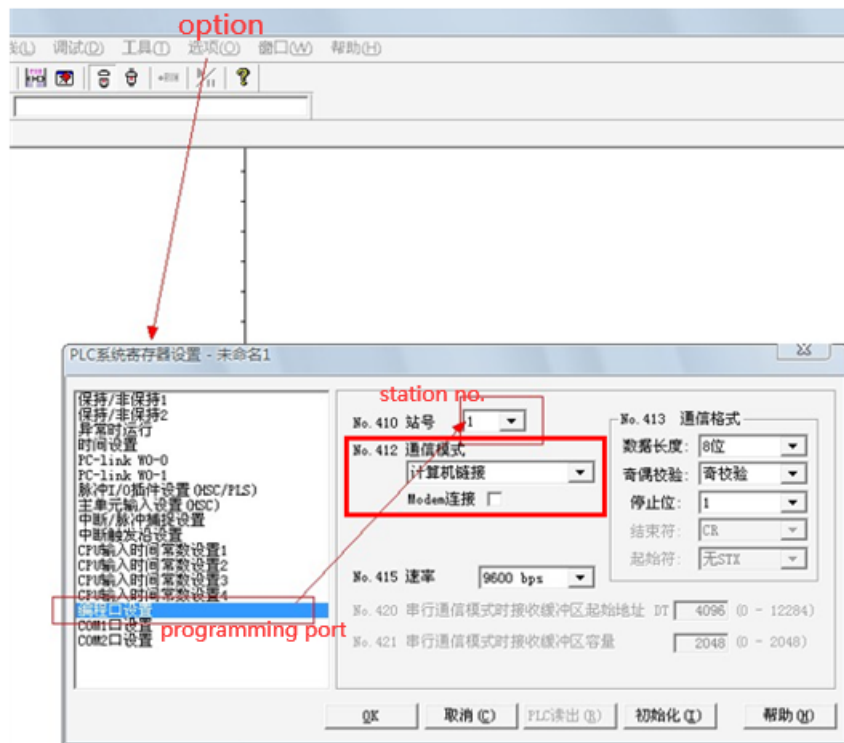

**Note:**

(1) Input mode of PLC software components:

| LC | HMI |
|---|---|
| R45 | R    4 5 |
| Y1 | Y    0 1 |

(2) When writing the PLC program, turn the dial switch to the PPOG state. During communication, turn the dial switch to Run status.

(3) Set the PLC station number and communication parameters, and do not select<General communication mode>, otherwise the communication will be abnormal.

(4) The default station number of FP series PLC is 1, but the FP3 model must be set to 0.
3. Cable making

① CPU unit 5-pin DIN male plug:

S-BOX-HT port

Matsushita mewnet-FP series CPU unit

SBOX-HT port

Diagram 4

## 4-6-11. Communicate with Simens S7-200 series PLC

1. Device type

| Series | CPU | Connection module | Port | Cable making | PLC selection in Touchwin software |
|--------|-----|-------------------|------|--------------|-------------------------------------|
| S7-200 series | CPU212 CPU221 CPU222 CPU224 CPU226 | CPU directly connection | RS485 | Diagram 1 | Siemens S7-200 series |
| S7-200 smart | Smart series | | | | |

2. Parameter setting

(1) HMI setting

| Parameter | Recommended setting | Optional setting |
|-----------|---------------------|------------------|
| PLC type | Siemens S7-200 series | |
| Port | RS485 | |
| Data bit | 8 | |
| Stop bit | 1 | |
| Parity | Even | |
| Baud rate | 9600 | 9600/19200/187500 |
| Station no. | 2 | |

Default communication parameters of Siemens S7-200 series protocols:

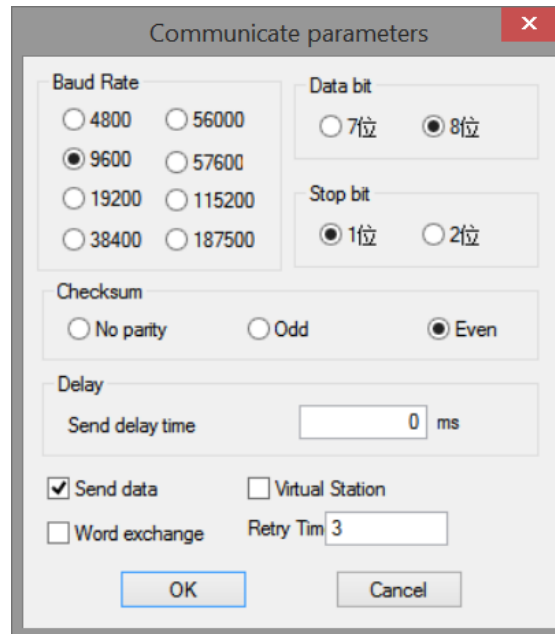

(2) S7-200 software setting:

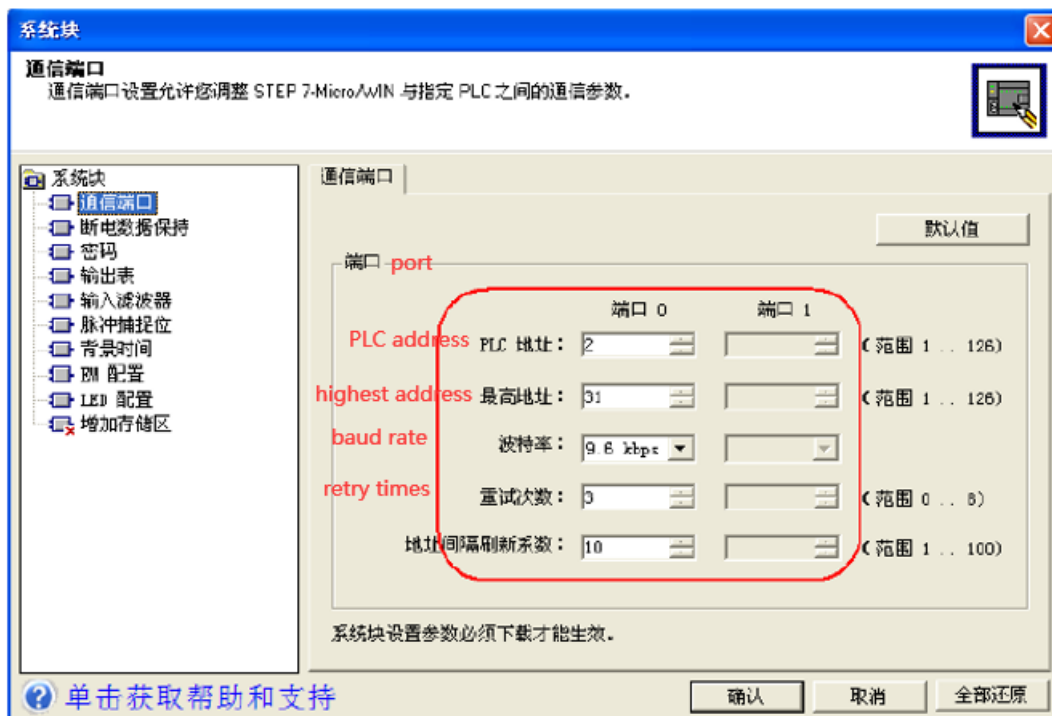

S7-200 communication precautions:

(1) Siemens register structure: VB occupies 8 bits, VW occupies 16 bits, and VD occupies 32 bits.

(2) The address space is overlapped, and VW must start with an even number and be divisible by 2, such as VW0, VW2, VW4..., and VD must be a multiple of 4, such as VD0, VD4, VD8.

(3) Data block PSW single word → VW single word: the received data may be misaligned due to the problem of distinguishing high and low bytes, so it is recommended to use the register copy function.

(4) Data block PSW single word → VD double word: the units are inconsistent, so it is not allowed to transmit in this way. It is recommended to use register copy.

3. Cable making

HMI and S7-200 uses RS485 connection mode:

SIEMENS PLC S7-200 series PPI port

S-BOX-HT port                                    9-pin D-type male plug

Diagram 1

# 5. PLC communication through S-BOX-HT

Wireless communication between PLCs can be realized through S-BOX-HT. The network connection diagram is as follows:

PLC communicates with S-BOX-HT through serial port, and two S-BOX-HTs communicate through wireless network. The following conditions shall be met for successful communication:

(1) The channel and air baud rate of S-BOX-HT and MTG765-HT must be consistent.

(2) The serial port of S-BOX-HT, PLC port of HMI programming software and serial port parameters of connecting equipment shall be consistent.

(3) RS232/RS485/RS422 wiring shall meet the specification.

As a transparent transmission module, S-BOX-HT theoretically supports communication with all serial devices. The following will illustrate the specific operation steps with Xinje XD series PLC as an example.

## 5-1. Operation steps

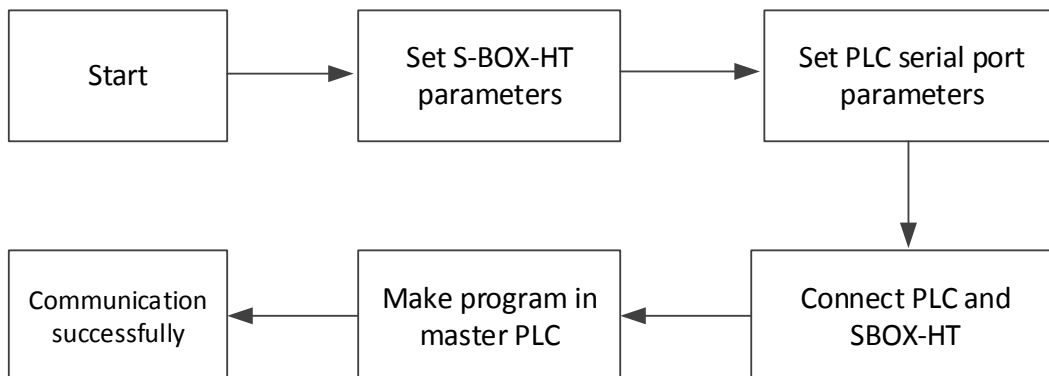

## 5-2. S-BOX-HT communication configurations

### 5-2-1. Preparation

1. S-BOX-HT configuration tool SBoxTool.exe
2. OP cable

Prepare an OP cable for connecting the DB9 pin serial port of the computer. If there is no OP cable, the cable can be self-made as shown in the figure below. If the computer does not have a DB9 pin serial port, a USB serial conversion module is also required.
## 5-2-2. S-BOX-HT configuration

1. Turn DIP 1 to ON, and TXD and RXD of the module flash at the same time, indicating that the module is in configuration mode.

2. Connect the computer and S-BOX-HT through OP cable or self-made cable.

3. Use OP cable or self-made cable to connect USB convertor to the computer, open SBoxTool.exe, select the corresponding COM port of the computer, and click to open the serial port. The information of the module can be read directly.

4. Set the serial port parameters of the module, which should be consistent with the connected PLC serial port parameters. The default serial port parameters are 19200, 8, 1, E. Click Write after setting.

5. RF parameters: set the channel of the module, and only devices with the same channel can communicate. The timeout is the allowable timeout on the wireless side, which is generally set to 500ms. Click Write after configuration.

6. After the module configuration is completed, set DIP 1 to OFF, and the module is set to the operation mode.

7. Set the DIP3 and DIP4 of S-BOX-HT according to the requirements of the "2-4. DIP switches" table. Only when they are consistent with the DIP switches of the HMI can communication be achieved.
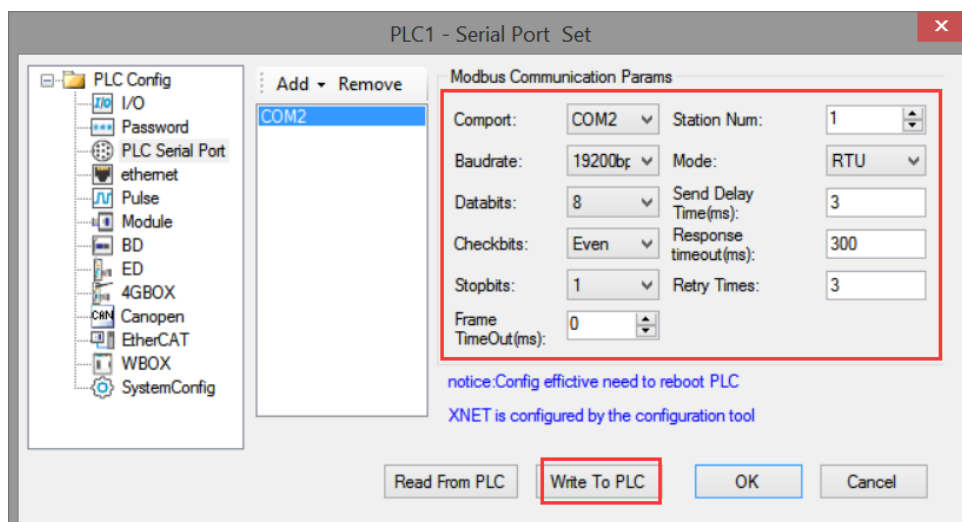

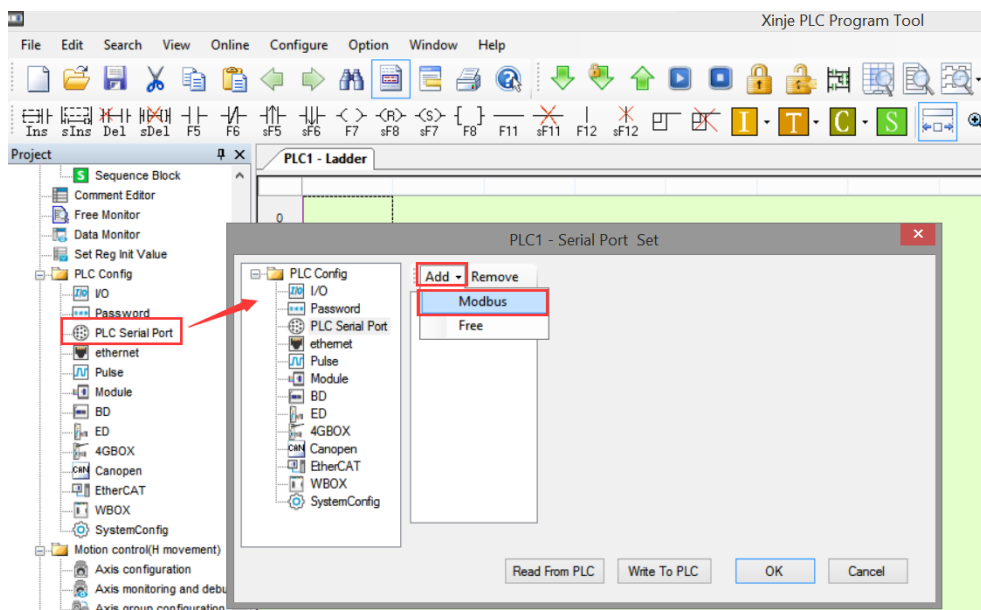

8. Configure the other S-BOX-HT in the same way. Please note that the parameters of the two modules are consistent.

## 5-3. Set PLC serial port parameters

1. Connect the computer and PLC through the programming cable:

2. Set the serial port parameters of PLC

The default communication parameters of Xinje XD/XE series protocols are 19200bps baud rate, 8 data bits, one stop bit and even parity.

After the parameters are modified, power on again, and the parameters take effect. The XD series COM2 port of Xinje is consistent with the default parameters of S-BOX-HT, so no special setting is required.

For other brands of PLC, refer to the section "4-6. Communication settings and connections of common PLC".

## 5-4. Connection between PLC and S-BOX-HT

After completing the parameter settings in the first two sections, as long as the connection between PLC and S-BOX-HT is successfully established, the remote communication between PLC and PLC can be realized. The following is an example of Xinje XD series PLC. For the corresponding pins of other brands of PLC, refer to the section "4-6. Communication Settings and Connections of Common PLCs". Connect the two S-BOX-HT to the corresponding PLC according to pin numbers and definitions.

COM1 port of Xinje XD series PLC is 8-pin RS232 port, as shown in Figure 1. COM2 port is AB terminal, A is RS485+, B is RS485-, as shown in Figure 2. The module has a DB9 pin and an external AB terminal. For the connection between the two, refer to the pin definition below:
1. XD/XL/XG series PLC CPU unit (RS232 port)

    S-BOX-HT port                                    Xinje XD/XE series PLC RS232 port

Diagram 1

2. XD/XL/XG series PLC CPU unit (RS485 port)

    S-BOX-HT port                                    Xinje XD/XE series PLC unit RS485 port

Diagram 2

After successful connection, remote communication between PLCs can be realized. After the parameters of PLC and S-BOX-HT serial ports are consistent, they can communicate normally. The XD series COM2 port of Xinje is consistent with the default parameters of S-BOX-HT, so no special setting is required. If other brands of PLC are used, please check the serial port parameters of S-BOX-HT and PLC.

## 5-5. Make PLC program

One PLC is the master station and the other is the slave station. The programming mode is MODBUS communication. The communication port is the serial port connected with S-BOX-HT. (For the usage of Xinje PLC, see User Manual for XD, XL Series Programmable Controllers [Basic Instructions])

The PLC serial port parameters shall be consistent with those in the SBOX-HT to ensure that the channel and dial switch baud rate of the two modules are the same.

For example, the communication between XD5 and XDM is completed through two S-BOX-HTs. XDM is the master station and XD5 is the slave station, realizing the following functions:

(1) Send the values of D0~D5 in slave station to D10~D15 in master station (REGR)

(2) Send the status of M0~M5 of slave station to M10~M15 of master station (COLR)

(3) Send M100 status of master station to M200 of slave station (COLW)

(4) Send M101~M105 status of master station to M201~M205 of slave station (MCLW)

(5) Send the D100 value of the master station to D200 of the slave station (REGW)

(6) Send the values of D101~D105 in the master station to D201~D205 in the slave station (MRGW)

Step 1: Configure two S-BOX-HTs according to the steps in Section 5-3. The default parameters are shown in the figure below. Select channel no.10 and click Write after modification.
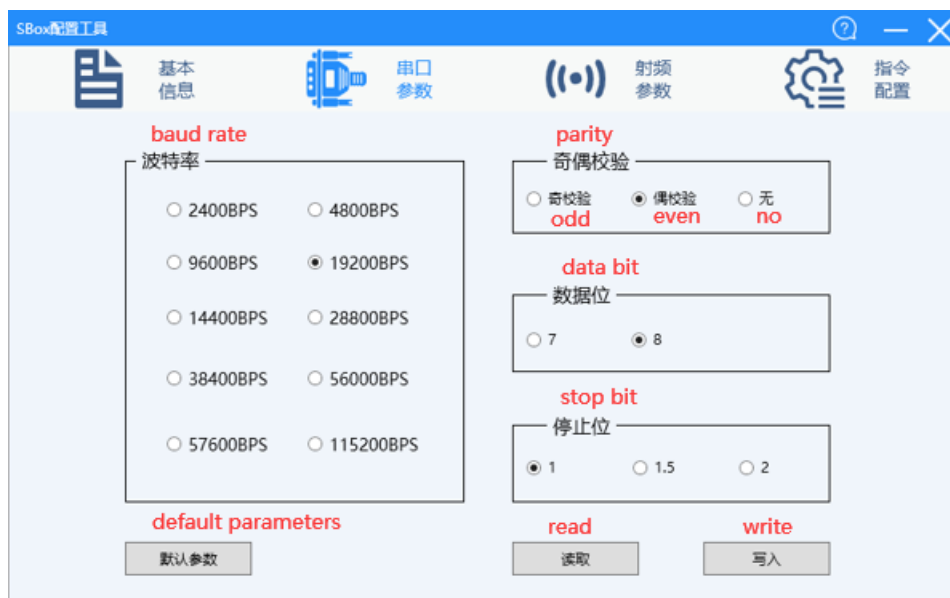

Step 2: COM2 port of PLC is used here, and the communication parameters are set as follows (consistent with S-BOX-HT):

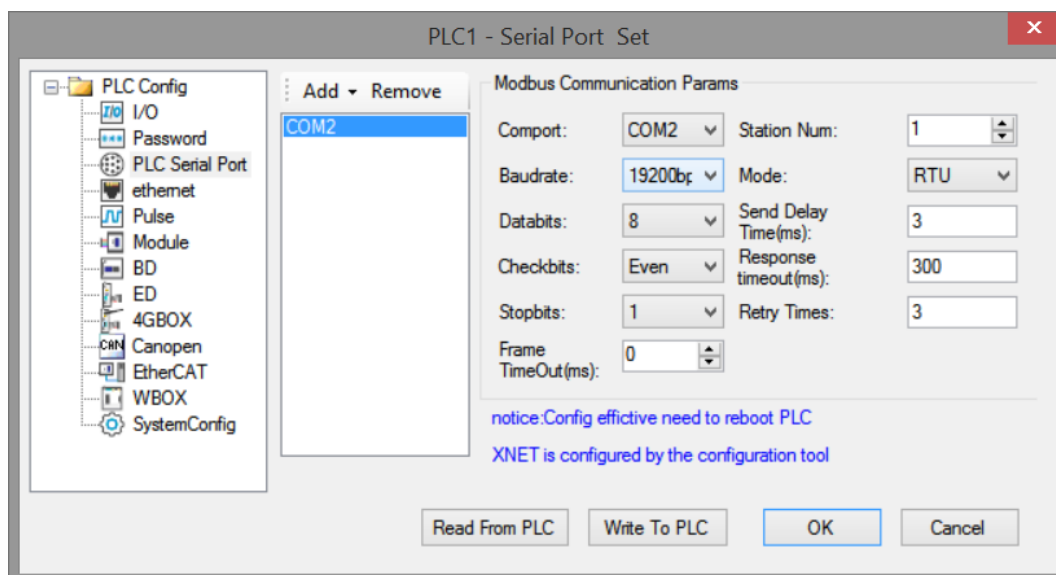

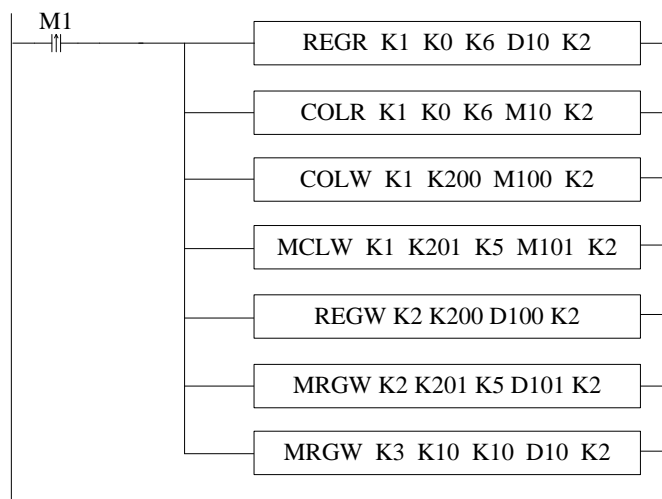

Step 3: Connect the external RS485 port of the S-BOX-HT to the RS485 port of the PLC (A to A, B to B). If other connection methods are used, refer to the pin descriptions in Chapter 4-6.

Step 4: Write MODBUS program

XDM is MODBUS master station, the program is as the following:

```
M1
─┤├───┬─── REGR  K1  K0  K6  D10  K2
      ├─── COLR  K1  K0  K6  M10  K2
      ├─── COLW  K1  K200  M100  K2
      ├─── MCLW  K1  K201  K5  M101  K2
      ├─── REGW  K2 K200 D100 K2
      ├─── MRGW  K2 K201 K5 D101 K2
      └─── MRGW  K3  K10  K10  D10  K2
```

XD5 is MODBUS slave station, it no need to make program.

Normal data transmission and reception between master station and slave station indicates successful communication. Data monitoring is as follows:

**Master station PLC**

| 寄存器 | 监控值 | 字长 | 进制 | 注释 |
